## 4 Gain Settings

In the following paragraph the power values for the corresponding max output power for each band class are reported. The appropriate gain settings are stored in each module individually. The user has no possibility to alter these settings later on. During manufacturing each module will be individually calibrated: the measurement is performed in a fully calibrated setup based on a base station simulator. For each channel (low, middle and high), the power level below displayed is firstly set and then verified in a call measurement. The tolerance level below applies for each channel on which the measurement is performed.

### 4.1 Maximum Output Power

Parameter	Min.	Typ.	Max.	Unit	Remarks
CDMA BC=0 (Cellular 800 MHz)	22	24	26	dBm	
CDMA BC=1 (PCS 1900 MHz)	22	24	26	dBm

## 4 RF Exposure Evaluation Requirements

### 4.1 FCC:

Calculations can be made to predict RF field strength and power density levels around typical RF sources using the general equations (3) and (4) on page 19 of the following FCC document:  
“OET Bulletin 65, Edition 97-01 - Evaluating Compliance with FCC Guidelines for Human Exposure to Radio frequency Electromagnetic Fields”.

The table below is excerpted from Table 1B of CFR 47 1.1310 titled Limits for Maximum Permissible Exposure (MPE), Limits for General Population/Uncontrolled Exposure:

Frequency Range (MHz)	Power density (mW/cm <sup>2</sup> )	Averaging time (minutes)
300 – 1500	f (MHz) /1500	30
1500 – 100.000	1.0	30

Using the equation from page 19 of OET Bulletin 65, Edition 97-01:

$$S = \frac{PG}{4\pi R^2}$$

where: S = power density (in appropriate units, e.g. mW/cm<sup>2</sup>)

P = power input to the antenna (in appropriate units, e.g., mW)

G = power gain of the antenna in the direction of interest relative to an isotropic radiator

R = distance to the center of radiation of the antenna (appropriate units, e.g., cm)

### **Additionally, according to § 2.1091:**

The limit for <1.5 GHz mobile operations where no routine evaluation is required is: 1.5W ERP

The limit for >1.5 GHz mobile operations where no routine evaluation is required is: 3W ERP

Note:

1. This report is based on the assumption that the product is only used for fixed and mobile applications.
2. For all use cases of the product the antenna(s) used for this transmitter must be installed to provide a separation distance of at least 20 cm from all the persons

### 4.2 IC:

#### **RSS-102 Section 2.5.2**

RF exposure evaluation is required if the separation distance between the user and the device's radiating element is greater than 20 cm, except when the device operates as follows:

- At or above 300 MHz and below 6 GHz and the source-based, time-averaged maximum e.i.r.p of the device is equal to or less than  $0.0131 \times f(\text{MHz})^{0.6834}$  W.

#### **RSS-102 4: RF Field strength limits for devices used by the General Public (Uncontrolled Environment):**

Power density

$$300\text{MHz}- 6000 \text{ MHz} = 0.02619 \times f(\text{MHz})^{0.6834} \text{ W/m}^2$$

Test Report #:	EMC-WIMML-004-15001_FCCICMPE	FCC ID:	2ABUE-BP200-2-2-1

## 5 Evaluation

### 5.1 Exclusion from routine evaluation

Peak radiated power is calculated as

$$\text{EIRP (dBm)} = \text{Maximum average output power (including tune-up tolerance) (dBm)} + \text{Antenna Gain (dBi)}$$

$$\text{ERP (dBm)} = \text{EIRP (dBm)} - 2.15$$

Maximum conducted output power values from presented radio module specifications (see section 3.7).

Antenna connection attenuations not taken into account.

Antenna gain as documented by the manufacturer (see section 3.1).

Analysis to Exclude Routine RF Exposure Evaluation for Stand Alone Operation						
Band of Operation	EIRP		IC Limit	ERP		FCC Limit
MHz	dBm	W	W	dBm	W	W
CDMA 850 824 to 849	26+1.5=27.5	0.562	1.288	25.35	0.343	1.5
CDMA 1900 1850 to 1910	26+2.4=28.4	0.692	2.239	26.25	0.422	3
Bluetooth LE 2400 to 2483.5	1.0+0.5=1.5	0.0014	2.675	-0.65	0.00086	3

Since the determined EIRP values are below the related IC limits all transmitters are exempt from routine evaluation for IC.

### 5.2 Power Density evaluation against FCC limits

Power Density Calculation						
Band of Operation	EIRP	Maximum Duty Cycle	Distance	Power Density	FCC Limit	Verdict
MHz	dBm	%	cm	mW/cm <sup>2</sup>	mW/cm <sup>2</sup>

CDMA 1900 1850 to 1910	28.4	100.00%	20	0.138	1.000	Pass
Bluetooth LE 2400 to 2483.5	1.5	66.00%	20	0.0002	1.000	Pass
